## Solenoid Control/Check/Thermal Relief Valve

### Description

The solenoid control/check/thermal relief valve shall open and close via discrete electrical signals. The valve shall be equipped with a two-way solenoid valve that will allow the valve to open when energized/deenergized. If downstream pressure becomes greater than upstream pressure, the valve shall close to prevent reverse flow; however, should downstream pressure increase to the set point of the thermal relief valve, this valve shall open to relieve the buildup to the upstream side of the valve. The thermal relief valve shall have an adjustable spring range of 50-350 psi. The OCV 115-26TR solenoid control valve is designed to open or close in response to an electrical signal. It will also close in the event of a pressure reversal, but will relieve thermal buildup from downstream to upstream. Typical examples include:

- Process control
- Petroleum loading terminals

### Features & Benefits

- Electrically operated solenoid allows valve to open or close
- Adjustable response speed
- Can be maintained without removal from the line
- Factory tested and can be preset to your requirements
- Thermal Relief - relieves thermal buildup from downstream to upstream.
- Field adjustable

### Certification & Compliance

NSF-ISO Quality System (9001)

ABS Type Approval

Technical Standards &amp; Safety Authority

American-Made: American Recovery &amp; Reinvestment

Pressure Equipment Directive Certified 97/23/EC

CE (Conformité Européenne) Compliance

### Typical Applications

Metering Systems

Loading Terminals

Storage Tanks

Truck/Rail Car Loading &amp; Unloading Systems

## Operation

A two-way solenoid, when closed, causes the main valve to close. Opening the solenoid opens the valve. The pilot system is equipped with a needle valve that allows the opening and closing speed of the valve to be adjusted.

If downstream pressure becomes greater than upstream pressure, the valve will close to prevent reverse flow; however, should downstream pressure increase to the set point of the thermal relief valve, this valve will open to relieve the buildup to the upstream side of the valve.

## Components

The OCV 115-26TR consists of the following components, arranged as shown on the schematic diagram:

- 1 Model 65 Basic Valve
- 2 Model 451 Two-Way Solenoid Pilot, N.C.
- 3 Model 126 Ejector
- 4 Model 141-2 Needle Valve
- 5 Model 141-1 Check Valve
- 6 Model 684703 Thermal Relief Valve
- 7 Model 123 Inline Strainer
- 8 Model 155 Visual Indicator (optional)

## Pressure Table

The OCV 115-26TR is normally sized to match the meter size; however, in no case should the maximum velocity exceed 20 ft/sec (metric: 6.10 meters/sec).

Resetting, maintenance and periodic testing instructions must be followed as described in detail in the applicable OCV IOM (Installation, Operation & Maintenance) Manual.

## Typical Materials

Part	Standard Material
Body/Bonnet	Ductile Iron (epoxy coated), Carbon Steel (epoxy coated), Stainless Steel, Aluminum
Seat Ring	Stainless Steel, Bronze
Stem	Stainless Steel, Monel
Spring	Stainless Steel
Diaphragm	Buna-N, Viton (Nylon reinforced)
Seat Disc	Buna-N, Viton
Pilot	Stainless Steel, Bronze
Other Pilot System Components	Stainless Steel, Bronze/Brass
Tubing & Fittings	Stainless Steel, Copper/Brass

## Engineering Specifications

The solenoid control/check/thermal relief valve shall be a single-seated, line pressure operated, diaphragm actuated, pilot controlled globe valve. The valve shall seal by means of a corrosion-resistant seat and a resilient, rectangular seat disc. These, and other parts, shall be replaceable without removing the valve from the line. The stem of the main valve shall be guided top and bottom by integral bushings. Alignment of the body, bonnet and diaphragm assembly shall be by precision dowel pins. The diaphragm shall not be used as a seating surface, nor shall the pistons be used as an operating means. The orifice plate shall be integrally installed in the valve inlet flange. The pilot system shall be furnished complete and installed on the main valve. It shall include a needle valve, inline strainer,

and solenoid valve. The solenoid valve shall be operationally and hydrostatically tested prior to shipment. The main valve body and bonnet shall be ductile iron. All ferrous surfaces shall be coated with 4 mils of epoxy. The main valve seat ring shall be stainless steel. Elastomers (diaphragms, resilient seats and O-rings) shall be Buna-N. The needle valve, check valve, thermal relief valve, and control line tubing shall be stainless steel. The solenoid shall have a stainless steel body, explosion-proof enclosure. The solenoid control/check/thermal relief valve shall be suitable for operation at <X> psi (see Pressure Table) and at flow rates up to <X> gpm (see Flow Chart). The solenoid control/check/thermal/relief valve shall be an OCV 115-26TR, as manufactured by OCV, Tulsa, OK, USA.
